

## **Final Diagnosis**

### **Differential Diagnosis**

- Basal cell carcinoma
- Squamous cell carcinoma
- Keratoacanthoma
- Lupus vulgaris

**Diagnosis:** Nodulo-ulcerative Basal Cell Carcinoma

### **Management**

- Treatment modality: Surgical excision with adequate margins
- Margin: 4 mm clinical margin
- Reconstruction: Local flap repair

### **Outcome and Follow-Up**

- Postoperative period was uneventful
- Histopathology of excised specimen showed tumor-free margins
- Patient advised strict photoprotection
- Follow up at 3-6 months interval.

### **CONCLUSION**

With a typical history, demographic details and age and site of presentation as seen in the above patient, we mostly narrow down our suspicions more likely to be that of malignancy. Nodule-ulcerative BCC is a slow growing, locally invasive and painless lesion and on biopsy the diagnosis is confirmed.

Lymphadenopathy and distant metastasis do not occur, hence with treatment it has good prognosis.
