

Patient Four Data:

Past History

- No history of similar lesions
- No prior radiation exposure
- No immunosuppression
- No family history of skin cancer

General Examination

- Vitals are stable
- No pallor, icterus, clubbing, or lymphadenopathy

Cutaneous Examination

- Site: Left nasal ala
- Size: 1.5 × 1.2 cm
- Morphology: Pearly nodular lesion with central ulceration
- Borders: Rolled, raised edges
- Surface: Shiny with visible telangiectasia
- **Tenderness:** Absent
- **Induration:** Present
- **Regional lymph nodes:** Not enlarged

Investigations

Dermoscopy:

- Arborizing telangiectasia
- Blue-gray ovoid nests
- Shiny white structures

Histopathological Examination:

Punch biopsy from the lesion showed:

- Nests and cords of basaloid cells arising from the epidermis
- Peripheral palisading of nuclei
- Retraction clefts between tumor islands and stroma
- Hyperchromatic nuclei with scant cytoplasm
